Wellsite Logging Desk

The whole mud logging shift, in one offline program

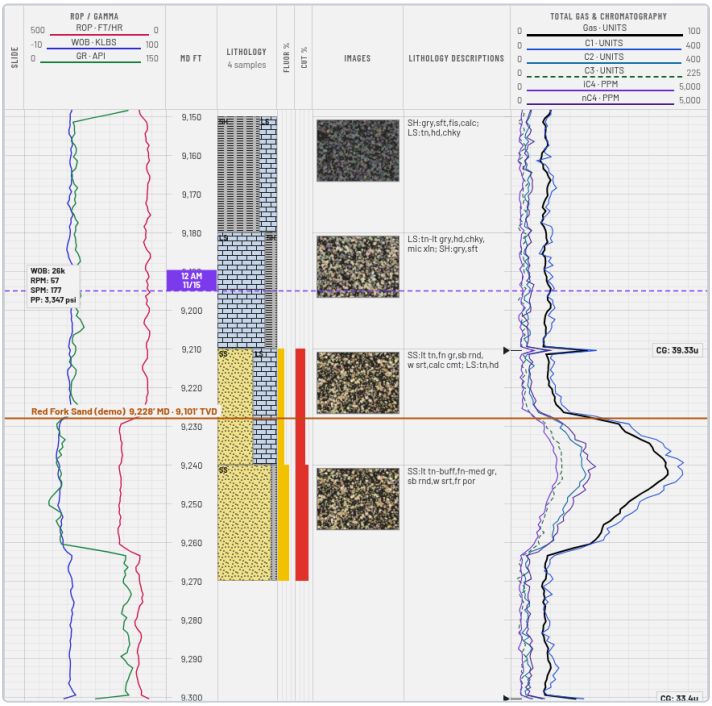
Built by a working Mud Logger with Directional Drilling and MWD experience. WLD takes the logger from LAS to finished log and report without a cloud account. It runs on any rig computer as a single file and keeps logging offline. It needs a signal about once a week to renew its license, and your logs never lock.

WHAT IT DOES

- **LAS import** and a live curve log: ROP, gamma, total gas and chromatography, with WOB, RPM, SPM and pump pressure tagged on the log
- **Lithology and descriptions** with tap-to-add AAPG-style chips, fluorescence and cut bars
- **Sample photos** placed right on the log, printed full size
- **Reads the geologic prognosis and BHA PDFs** and drops planned tops onto the log
- **Lag and bottoms-up** calculations
- **Clean 1", 2" and 5" PDF logs**, plus morning, afternoon and night reports ready to email or text
- **Well file backup** so a crew change never loses the well

WHY IT MATTERS

- No install and no IT ticket. Copy one file to the rig computer, activate it, and go.
- Works with no signal. No well data leaves location unless the logger sends it.
- Carries your company's name on every log and your logo on every report.
- Built from the logging unit, so every button saves a real step on tour.
- Wellsite data stays structured and ready for whatever analytics or AI your office runs next.



WLD curve log: ROP, WOB and gamma, drilling parameters (WOB, RPM, SPM, pump pressure), total gas with C1 through C4, lithology, sample photos, a connection gas, midnight marker and formation top (demo data).

HOW IT COMPARES

	WLD	Cloud mudlog suites
Internet needed	Once a week	Usually
Install	None	Yes
Your branding	Yes	Limited
Prognosis PDF import	Yes	Varies

> **Try it on your rigs.** A founding pilot for one shop, branded for your company, with direct support from the developer. White-label licensing per trailer desktop seat after that.
